

SOV-127-58-9-1C/20

New Data on the Concentration of Iron Ores of the Nizhnyaya Angara Deposits

M.G. Kurochkin, N.S. Kosul'nikova, A.S. Kozhevnikov, S.M. Luk'yanov, V.B. Lutsiyan, V.V. Makarov, D.Ye. Necheporenko, and G.L. Suslikova in 1957-58, they also found the possibility of obtaining much better results of the concentration by the magnetic-roasting method. According to their findings, the optimum degree of reduction of roasted ore is in the 120-150 % range, as compared with 83-102 % findings of the Mekhanobr (Fig. 1). Research on various reducers showed that the best results of reducing were obtained when coal was used as fuel. Its use allowed the necessary degree of reduction to be obtained at a temperature of 650-700°, which must have been much higher when gas was used as a fuel. As the Krasnoyarsk region has huge reserves of brown coal, it was decided to use only the magnetic-roasting method. Brown coal consumption amounted to 8.1 % of the processed ore on the average. The low cost of brown coal makes this method highly profitable. The crushed ore of class minus 12 mm was subjected to the magnetic-roasting process; after that it was divided into two classes of plus 2 mm and minus 2 mm. The ore of class plus 2 mm was then subjected to the dry magnetic separation and the obtained concentration, together with ore of class minus 2 mm,

SOV-127-58-0-10/20

New Data on the Concentration of Iron Ores of the Nizhnyaya Angara Deposits

was again subjected to wet magnetic separation. Further concentration operations were continued, according to two schemes elaborated by the Mekhanobr Institute (Fig. 2) and the Sibe-
elektrostal' Plant (Fig. 3). Best results were obtained with ores reduced by 120-150 % (Table 3). After testing the obtained concentrates with various iron ores of the Nizhnyaya Angara deposits, the Sibe-
elektrostal' Plant proposed a general method of concentration for all ores of the region. The cost of cast iron obtained from the concentrates (Table 7) of ores of the Nizhnyaya Angara deposits is, after the Magnitogorsk cast iron, the lowest in the Union.

There is 1 graph, 7 tables and 5 schemes.

TITLE: **Journal of Abstracts** "Geografiya" (Referativnyy zhurnal "Geografiya")

PERIODICAL: Izvestiya Akademii Nauk SSSR, Seriya Geograficheskaya, 1958, Nr 3, page 158 (USSR)

ABSTRACT: The journal "Geografiya" is going to publish special booklets describing different parts of the USSR, Canada and Japan. Another publication will deal with the shipbuilding areas of the world. In 1956/57 the journal had already published the following booklets: "Ferrous Metallurgy in the Leading Capitalistic Countries and Their Raw Material Resources" by M.S. Rozin and Yu.V. Medvedkov; "Power Engineering in Capitalistic Countries" by O.V. Vitkovskiy; "Economic Resources in India and Their Utilization" by F.D. Yaroshenko; and others.

med 1412. CLINIC AND PATHOGENESIS OF TRAUMATIC CYSTS OF THE IRIS (Russian text) - Medvedovskaya T. P. - OFTALM. ZH. 1956, 4 (210-214)

Three cases of traumatic iridial cysts have been observed which were very different in their clinical picture and origin. In a case of a serous iridial cyst the author regarded an operation - a cataract extraction - as the traumatic factor. In a case of a migratory serous cyst a perforating injury of the limbar portion had been sustained. In a case of a pearl cyst of the iris with cilia on the anterior capsule of the crystalline lens there was a perforating corneal injury. The observed cases support the opinion of the majority of authors that trauma has great significance in the pathogenesis of serous cysts of the iris, in that fragments of conjunctival or limbal epithelium are implanted through the wound into the tissue of the iris. The pearl cysts develop when epithelial cells from epidermis, and cornified cells from sheaths and hair follicles, cornea and conjunctiva, following trauma are implanted into the iris and continue to grow.

TITLE: The accumulation of incorporated radioactive phosphorus in eye tissues and its elimination

SOURCE: Radiobiologiya, v. 5, no. 2, 1965, 213-217

TOPIC TAGS: animal, rabbit, phosphorus-32, eye, tissue, half life, radioactivity measurement, exponential equation, radiobiological parameter

ABSTRACT: The nature of phosphorus-32 distribution in eye tissues following single dose administration was investigated to determine the radiobiological parameters and to formulate empirical equations for elimination processes as a function of

the radiobiological parameters and to formulate empirical equations describing the accumulation-elimination processes as a function of time. In experiments on 21 rabbits weighing 2.2 ± 0.3 kg, a single P^{32} dose with a concentration of 250 microcuries/kg was introduced subcutaneously. Animals were killed by air embolism over a period of 1 to 60 days. Radioactivity of eye tissues was measured by a B-2 unit with a MST-17 counter. On the basis of P^{32} radioactivity

TITLE: Phosphorus³² distribution in rabbit eye tissues following multiple dose administration

SOURCE: Meditsinskaya radiologiya, v. 10, no. 3, 1965, 57-60

TOPIC TAGS: rabbit, phosphorus 32, eye, tissue, radioisotope, effective half life, dosage

ABSTRACT: In experiments on 26 rabbits P³² distribution in eye tissues was investigated after prolonged administration of the isotope and results were compared with literature data for single dose administration. Experimental animals weighing 2.2±0.3 kg received P³² subcutaneously in daily doses of 1 microcurie/kg for periods up to 17 mos. Animals were killed at periods ranging from 4 days to 17 mos after P³² was first introduced. P³² concentration and elimination from the various eye tissues were measured by direct radiometry of eye tissue suspensions. The dynamics of P³² distribution was expressed by curves showing concentration changes. With

Card 1/3

L 3201-56

ACCESSION NR: AP5009200

repeated administration 0.01% of the daily dose was found in the eyeball during the equilibrium period. The equilibrium concentrations of P³² for all the eye tissues did not differ much from one another (0.002-0.003 microcurie/g). A slightly higher equilibrium concentration (0.005 microcurie/g) was found for the iris and for the ciliary body. The equilibrium period is attained in the cornea by the 20th to 30th day, in the iris and ciliary body by the 30th to 45th day, and in the crystalline lens by the 45th to 60th day. In comparing P³² distribution data for single dose (250 microcuries/kg), the same concentration (.01 microcurie/kg) was found in the eyeball as for daily administration. Approximately 36% of the P³² is eliminated from the eye tissues during the effective half life period (30 hrs) and the remaining P³² is eliminated in 10 days. P³² distribution in the eye tissues is more uniform with daily dose administration than with a single dose, except for distribution in the crystalline lens which is not uniform in either case. No significant differences were found in P³² concentration indices for the eye or its separate tissues with single or multiple dose administration. Orig. art. has: 3 tables and 2 figures.

electrophysiological method of testing the olfactory analyser (Russian text) SBORNIK. VOP. KLIN. FIZ. VOTO-RINOLARING. 1955 (91-98) Illus. 6

The bioelectrical activity of the cerebral cortex was examined in 57 persons with the simultaneous stimulation of the olfactory analyser. Twenty-seven persons examined suffered from various lesions of the nose and air sinuses. Threshold stimuli (4-6 ml. of air containing an aromatic substance) produced depression of the α -wave. The inhibiting action of this stimulation on the α -waves in persons with normal smell lasted for 30-60 sec. The latent period was of 1-2-seconds' duration. In cases of impaired sense of smell there was prolongation of the latent period to 2-2.5 sec. In diseases accompanied by complete loss of smell, the sniffing of the aromatic substance did not produce any change in the bioelectrical activity of the cerebral cortex. There was no difference in the reaction of the cerebral cortex to the different kinds of smells.

✓ The measurement of the oxidation-reduction potential of systems during radiation, V. I. Medvedovskiy, N. A. Ilukhi, and E. V. Zhuravskaya, *Sbornik Rabot Radiatsionnoi Khim., Akad. Nauk S.S.S.R.* 1955, 71-8. An apparatus is described for the measurement of the potential of solns. irradiated by Röntgen tubes at 70 kv. and 100 ma. with beam vertically upward. A looped Pt-wire electrode (1 mm. in diam.) was rotated (60-3000 r.p.m.). The power (measured by the ferrous sulfate dosimetric method) was 2.7×10^{14} e.v./cc.-sec. Solns. of 0.8N H₂SO₄ contg. 6.0×10^{-5} moles/l. Fe⁺⁺, and 0.012×10^{-5} moles/l. Fe⁺⁺⁺ were irradiated, and the potential of the system followed until the Fe⁺⁺ concn. was 0.13×10^{-5} moles/l. and the Fe⁺⁺⁺ concn. was 5.95×10^{-5} moles/l. In all cases, the measured potential agreed closely with the standard (unirradiated) solns. of corresponding concn., and appeared to be a function primarily of the ratio [Fe⁺⁺⁺]/[Fe⁺⁺]. These results were duplicated with 0.8N HClO₄. In the case of HNO₃, this relation no longer held because of the effect of radiation on the NO₂⁻ ion. C. H. F.

MEDEVEDOVSKIY, V.I.

AUTHORS: Popov, M. I., Medvedevskiy, V. I., Bakh, N. A. 89-2-7/35

TITLE: The Effect of Irradiation on the Valence State of Nitrates-of-Plu-
tonium-Solutions (Vliyaniye izlucheniya na valentnoye sostoyaniye
plutoniya v azotnokislykh rastvorakh).

PERIODICAL: Atomnaya Energiya, 1956 No. 2, pp. 154-160 (USSR).

ABSTRACT: The investigations were conducted with 0,3 to 2,0 molar nitrates-of-
plutonium solution as well as with 0,3 molar nitric acid, which con-
tained different concentrations of $UO_2(NO_3)_2$ and $K_2Cr_2O_7$.
An X-ray tube (50 kV, 200 mA) was employed as radiation source. The
temperature of the liquids was controlled by a thermocouple. The dose
symetric quantity, which was used to irradiate the liquids, was de-
termined with the help of a ferrous sulfate-dosimetric method. The
doses used were between $5 \cdot 10^{16}$ to $9 \cdot 10^{16}$ eV/cm³.sec.
The valence states of Pu were determined from the common pairs of
 $PuO_2^+ + PuO_2^{++}$ and $Pu^{+3} + Pu^{+4}$.
An irradiation of nitrates-of-plutonium-solutions, which contain no
 $UO_2(NO_3)_2$, causes only an oxidation of plutonium. The intensity of
the oxidation decreases with an increasing concentration of the NO_3^-

Card 1/2

The Effect of Irradiation on the Valence State of Nitrates-of-Plu= 89-2-7/35
tonium-Solutions.

ions and of the acidity. The assumption is pronounced, that the oxidation is caused by the OH - radicals. In the presence of $UO_2(NO_3)_2$ a reduction of plutonium occurs on certain conditions, which is caused apparently not by the atomic hydrogen, but by the UO_2 -ions. An addition of potassium bichromate has an accelerating effect on the radiation oxidation of plutonium. On certain experimental conditions, however, an addition of $K_2Cr_2O_7$ does not prevent the reduction of plutonium. There are 2 figures, and 15 references, 4 of which are Soviet.

TITLE:

The Simultaneous Polarographic Determination of Oxygen and Hydrogen Peroxide in the Process of Their Formation Under the Influence of Irradiation (Odnovremennoye polyarograficheskoye opredeleniye kisloroda i perekisi vodoroda v protsesse ikh obrazovaniya pod deystviyem radiatsii)

PERIODICAL:

Zhurnal Fizicheskoy Khimii, 1958, Vol. 32, Nr 4, pp. 932-934 (USSR)

ABSTRACT:

The application of the polarographic method was independent of the present work simultaneously proposed by V. I. Veselovskiy et al. (Ref 1), with the difference that the latter used the anodic polarographic determination with rotating platinum electrode and the former the cathodic polarographic determination with dropping mercury electrode. In principle the technique of measurements consists of the fact that after a certain energy absorption by the solution the function diagrams of the current are incorporated by the potential without interrupting radiation, and that from this the concentration of hydrogen peroxide is determined. However, no linear function as mentioned in references was found here. In order to make

Card 1/2

The Simultaneous Polarographic Determination of Oxygen and Hydrogen Peroxide in the Process of Their Formation Under the Influence of Irradiation 76-32-4-33/43

possible the simultaneous determination of oxygen and hydrogen peroxide as function of the amount of absorbed energy an apparatus was constructed which consists of one cell with two capillaries to the mercury inlet, with two potentials being connected according to the reduction of oxygen or hydrogen peroxide respectively. In the present case 0,6 and 1.4-1.6 Volt were used with the different concentrations of sodium nitrate. The data of hydrogen peroxide- and oxygen formation obtained by this method as well as their classification are mentioned in another paper (Ref 4). The method not only makes possible the determination of the changes of concentrations but also data on their nature, as there is the occurrence of molecular oxygen in the decay of hydrogen peroxide. There are 3 figures and 4 references, 3 of which are Soviet.

AUTHORS: Artyukhin, P. I., Gel'man, A. D., Medvedovskiy, V. I. SOV/20-120-1-25/63

TITLE: Investigation of the Redox Potentials of Plutonium in Nitric Acid (Issledovaniye okislitel'no-vosstanovitel'nykh potentsialov plutoniya v azotnoy kislote)

PERIODICAL: Doklady Akademii nauk SSSR, 1958, Vol. 120, Nr 1, pp. 98-100 (USSR)

ABSTRACT: The authors determined the formal redox potentials of various plutonium pairs in nitric acid solutions of different concentrations, as well as the disproportionating of Pu (IV) in nitric acid solutions. The potentials of the pair Pu(IV) - Pu(III) were measured at 25° in a carefully purified nitrogen atmosphere by means of an apparatus already described earlier (Ref 10). These measurements were carried out within the whole range of the ratios of the concentrations of Pu(IV) and Pu(III). The experiments of the direct determination of the potentials of the pairs Pu(VI) - Pu(IV) did not turn out to be successful. The measurement of the formal potentials of the pair Pu(VI) - Pu (IV) was carried out by

Card 1/3

SOV 20-120-1-25/63

Investigation of the Redox Potentials of Plutonium in Nitric Acid

disproportionating of Pu(IV) at low concentrations of nitric acid. This disproportionating of Pu(IV) was carried out at 25°. From the redox potentials measured on conditions of equilibrium and from the values of equilibrium concentrations the formal potentials for the pairs Pu(IV) - Pu(III), Pu(VI)-Pu(IV) and Pu(VI) - Pu(III) are calculated and given in a table. The formal potentials of the pairs Pu(VI) - Pu(IV), Pu(VI) - Pu(III) highly increase with increasing concentration of the hydrogen ions. The potentials of these pairs depend as the fourth power on the concentrations of the ions H⁺. The reactions taking place at the electrode are written down. Using these equations the formal potentials of the pairs Pu(VI) - Pu(IV) and Pu(VI) - Pu(III) in 1 N HNO₃ are calculated. The results obtained agree well with those of other authors. Proceeding from the discussed considerations schemes for the formal potentials of plutonium in nitric acid solutions are proposed and given. A diagram shows the changes of the concentrations of Pu(III), Pu(IV) and Pu(VI) with progressing time in 0,40 N HNO₃. In spite of the existing complex formation of Pu(IV) the constants of the velocity of the disproportionating of Pu(IV) in nitric acid
